

Install an iSpeak Browser Extension

Live translation into Hmong & 100+ languages, right in Chrome.

 **Pick only what you want — you don't need all three.** Each one installs the same way; the steps below work for whichever you downloaded.

Jump to the one you have:  [MovieDub](#) ·  [Article](#) ·  [PodcastDub](#)

① Get your iSpeak API key required

The extensions are free to install, but they need an iSpeak / Paj Hlub **API key** to translate and speak.

1. Go to silverfamilytree.com/pajhclub-audio.html and choose a plan (a free tier is available).
2. You'll receive a key that looks like `sft_live_xxxxxxx...` — keep it private. **One key works in all of the iSpeak extensions.**

② Install it in Chrome

These aren't on the Chrome Web Store yet, so you load the one you chose yourself — about a minute:

1. **Download** the extension's `.zip` from the [home page](#) (just the one you want), and **unzip** it — remember where the folder lands.
2. In Chrome, open `chrome://extensions`
3. Turn on **Developer mode** (toggle, top-right).
4. Click **Load unpacked** → select the **unzipped folder**.
5. The black-and-white icon appears — click the **puzzle-piece**  and **pin** it. (Repeat only if you want another one.)

Chrome may say it "isn't from the Web Store" — that's normal for a direct install. Set your key once via the  in the panel; close any panel with the ✕.

③ Use the one you installed

iSpeakMovieDub — YouTube, Netflix & Amazon Prime

1. Open something with subtitles available — a **YouTube** video with real captions (e.g. TED talks), or a movie/show on **Netflix** or **Amazon Prime Video**.
2. Click the pinned **iSpeakMovieDub** icon → its panel opens. Click  to paste your key (once).
3. Turn subtitles/**CC ON** — on Netflix/Prime, pick the **English** subtitle track (it reads them to translate) — then pick your language and click  **Active**.

Netflix & Prime are DRM-protected, so iSpeakMovieDub reads the on-screen **subtitles** (it can't hear the movie) — they must be turned on. It then speaks your language over the show and shows the translated text on screen.

iSpeakArticle — any article

1. Open any article, click the pinned **iSpeakArticle** icon → its panel opens. Click  to paste your key (once).
2. Pick your language, click  **Click-to-Read**, then **tap any paragraph** — it reads aloud from there.

iSpeakPodcastDub — any playing audio

1. Open a page with a playing podcast/audio, click the pinned **iSpeakPodcastDub** icon → a popup opens (Chrome requires tab-audio capture to start here). Paste your key there.
2. Pick your language and click **Start** — a bar appears while it dubs. Click its ✕ to stop.
